MEIGHBORING COSMID INFORMATION:
The 5' cosmid is CA1A3, 1000 bp overlap; 3' end lies in a gap
followed by the cosmid T23F2. Actual start of this cosmid is at
base position 1 of CELC25F6; actual end is at base position 43803
of CELC25F6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             NOTES:

                                                                                  A novel method has been developed for detecting the splicing defect in the dihydropyrimidine dehydrogenase (DPD) gene. The method comprises determining whether genomic DNA containing the DPD gene has a wild-type intron-exon boundary for an exon that encodes amino acids (aa) 581-635 of the corresponding DPD protein. The present sequence represents a DPD genomic fragment which encodes the amino acids 581-635. The method is used specifically to determine sensitivity of subjects to the anticancer agent 5-fluorouracil, which is dangerously toxic to those with DPD defects. It can also be used to diagnose DPD-deficiency disorders such as uraciluria.
                                                                                                                                                                                                                                                                                                                                                                                   240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a monoclonal antibody (MAb) specific for dehydropyrimidine dehydrogenase (DPD). This MAb is used as immunoassay reagents to identify a lack of DPD in a patient and to assess the sensitivity of cancer patients to treatment with antitumor agents of the 5-fluorouracil (5-FU) type. The MAb can also be used for affinity purification of DPD. DPD is involved in reduction of 5-FU (and related catabolites and derivatives) and lack of it is associated with increased toxicity of this type of antitumor agent. It has specific binding interaction. The MAb provide a sensitive and reliable test for DPD, which is simple, rapid and suitable for routine screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                840

The DPD gene, DPYD, is located at chromosome 1p22. The cDNA can be inserted into a vector and used for prodn. of DPD (AAR91420) in transformed host cells, or used as a selectable marker that functions in prokaryotic and eukaryotic cells. It can also be utilised as a probe to detect DPD deficiency in an individual, i.e. to identify risk of toxic reaction to 4-fluorouracil.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Bovine; liver; human; dihydropyrimidine dehydrogenase; DPD; pyrimidine catabolism; 5,6-dihydropyrimidine; pyrimidine analogue; fluoropyrimidine; anticancer drug; 5-fluorouracil; FUTa; cancer; frameshift mutation; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
      dihydropyrimidine dehydrogenase (DPD). DPD catalyses the initial and rate limiting step in pyrimidine catabolism, the reduction of pyrimidines to 5.6-dihydropyrimidines. DPD is a complex enzyme consisting of two identical subunits, containing FWN. FAD and ironsulphur centers, and utilising NADPH as a cofactor. DPD has also been shown to catalyse the reduction of various pyrimidine analogues including the fluoropyrimidine anticancer drug 5-fluorouracil (FUra). Up to 85% of administered FUTA may be used in the detection of DPD in a sample, esp isolated from a cancer patient. According to the amount of DPD detected, a therapeutically effective amount of FUTA may be determined and administered. DPD deficiency, leading to life-threatening toxicity on exposure to FUTA, in a human caused by a frameshift mutation may be determined by means of a molecular biological assay to detect the deletion of an A residue at codon 318 within the

pyrimidine dehydrogenase (DPD). This sequence was amplified using the primer sequences given in AAT03144-47. DPD catalyses the initial and rate limiting step in pyrimidines catabolism, the reduction of pyrimidines to 5/6-dihydropyrimidines. DPD is a complex enzyme consisting of two identical subunits, containing FMN, FAD and ironsulphur centers, and utilising NADPH as a cofactor. DPD has also been shown to catalyse the reduction of various pyrimidine analogues. Up to 81% of administered FUR as a catabolised by DPD, and it therefore governs the effectiveness of FUR as an anticancer drug. DPD genes or fragments of them may be used in the detection of DPD in a sample, esp. isolated from a cancer patient. According to the amount of DPD detected, a therapeutically effective amount of FUR and administered. DPD deficiency, leading to life. Chreatening toxicity on exposure to FUR's, in a human caused by a frameshift mutation may be determined by means of a molecular biological assay to detect the deletion of an A residue at codon 318 within the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1764 caccaaaactttctctcttgataaggacattgtgacaaatgtttcccccagaatcatccg 1823

                                                                                                                                    à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      dihydropyrinidine dehydrogense (DDD). DDD catalyses the initial and rate limiting step in pyrimidine catabolism, the reduction of pyrimidines to 5.6-dihydropyrimidines. DPD is a complex energine consisting of two identical subunits, containing FMN. FAD and ironsulphur centers, and utilising NADPH as a cofactor. DPD has also been shown to catalyse the reduction of various pyrimidine analogues including the fluoropyrimidine anticancer drug 5-fluorouracil (FUra). Up to 85% of administered FUra may be catabolised by DPD, and it therefore governs the effectiveness of FUra as an anticancer drug. DPD genes or fragments of them may be used in the detection of DPD in a sample, esp. isolated from a cancer patient. According to the amount of DPD detected, a therapeutically effective amount of FUra may be theratening toxicity on exposure to FUra, in a human caused by a frameshift mutation may be determined at codon 318 within the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

This sequence represents the cDNA sequence encoding bovine liver dihydropyrimidine dehydrogenase (DPD). This sequence was isolated using the primers given in AAT03134-41 and AAT14638. DPD catalyses the initial and rate limiting step in pyrimidine catabolism, the reduction of pyrimidines to 5,6-dihydropyrimidines. DPD is a complex enzyme consisting of two identical subunits, containing FMN, FAD and iron-
Bovine; liver; human; dihydropyrimidine dehydrogenase; DPD; pyrimidine catabolism; 5,6'dihydropyrimidine; pyrimidine analogue; fluoropyrimidine; anticancer drug; 5-fluorouracil; FUra; cancer; frameshift mutation; ss.

                                            therefore governs the effectiveness of Fura as an anticancer drug.
DPD genes or fragments of them may be used in the detection of DPD in a sample, esp. isolated from a cancer patient. According to the amount of DPD detected, a therapeutically effective amount of FUra may be determined and administered. DPD deficiency, leading to life-threatening toxicity on exposure to FUra, in a human caused by a frameshift mutation may be determined by means of a molecular biological assay to detect the deletion of an A residue at codon 318 within the

Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CCACCTCTGGCCCCATGTATGGCCCTGGACAAAGCTCCTTTCTGAATATTGAGCTCATCA, 368
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9 AAGATAAATATTTTTTTTTTCCTTGTTCTAAACCTAGGGTTACAAGAAGTAATTTATC 68

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            362 жынынынынынынынынынынынынынындестанынынынынынынынынын 421
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (FTM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
